What is Immunogenicity?

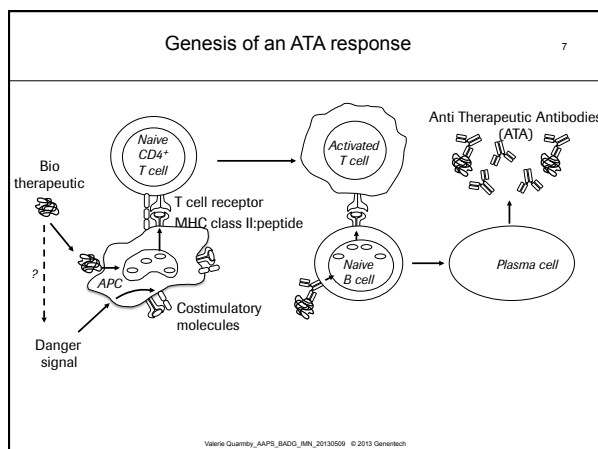

4

- In the context of biotherapeutics, immunogenicity refers to the production of an unwanted immune response.
- One hallmark of immunogenicity is the presence of host antibodies directed at the biotherapeutic in the circulation. These are typically called anti-therapeutic antibodies (ATA) or anti-drug antibodies (ADA)
- Clinical consequences vary.

Immunogenicity in Biotherapeutic Development 5
<p>□ Immunogenicity of biotherapeutics is a high profile concern for industry and for regulatory authorities</p> <ul style="list-style-type: none"> • Immunogenicity may impact safety and/or efficacy • FDA & EMA require that immunogenicity of biotherapeutics be evaluated • Development of biotherapeutics for chronic use is increasing the need to understand potential implications of immunogenicity • Immunogenicity strategies and data are essential components of Target Product Profiles, INDs, BLAs, CTDs & USPIs <p style="text-align: center; font-size: small;">Valerie Quarmby_AAPIS_BADO_IMN_20130509 © 2013 Genentech</p>

Immunogenicity & Clinical Sequelae	
Clinical Impact	Clinical Outcome
Safety	<ul style="list-style-type: none"> ➢ Hypersensitivity or anaphylactic reactions ➢ Neutralize activity of endogenous counterpart with unique function causing deficiency syndrome ➢ Immune complex formation
Efficacy	<ul style="list-style-type: none"> ➢ Neutralize activity of therapeutic protein ➢ Increase or decrease efficacy by extending or curtailing half life ➢ Increase or decrease efficacy by changing bio-distribution
Pharmacokinetics	<ul style="list-style-type: none"> ➢ Extend, or curtail half life life ➢ Alter biodistribution ➢ PK changes may dictate changes in dosing
None	<ul style="list-style-type: none"> ➢ No discernible impact

Immunogenicity Assessments in Biotherapeutic Development

16

Valerie Quarmby_AAP9_BADO_IMN_20130509 © 2013 Genentech

Immunogenicity Risk Assessment

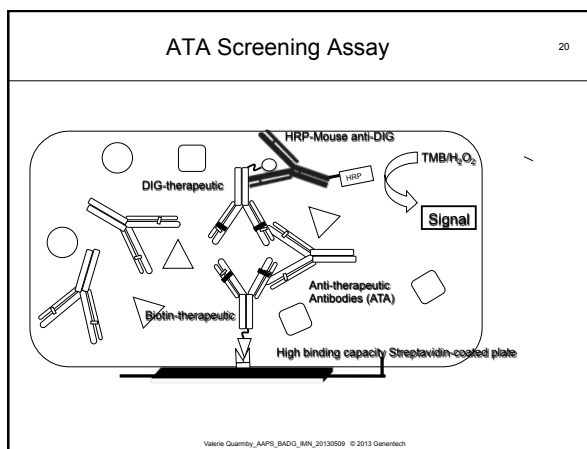

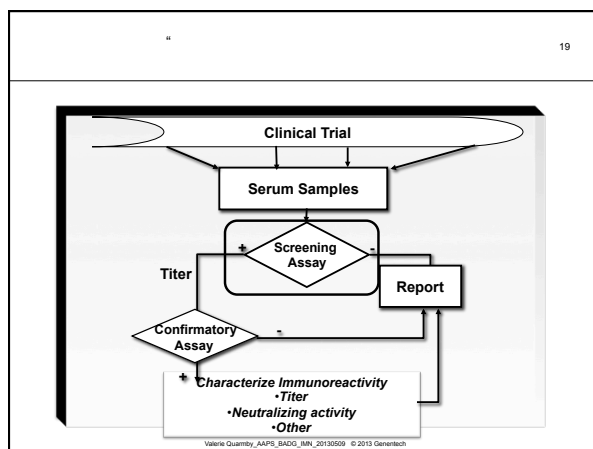

Higher Risk	Lower Risk
<ul style="list-style-type: none"> Existence of endogenous counterpart Unique activity Sole therapy Non Life threatening disease Chronic treatment Replacement therapy Non - immunosuppressed subjects 	<ul style="list-style-type: none"> No endogenous counterpart Redundant activity Other therapies Life threatening disease Single dose treatment Non replacement therapy Immunosuppressed subjects

Immunogenicity of the administration route: intradermal > inhalation > subcutaneous > intraperitoneal > intramuscular > intravenous

Recommendations on Risk-Based Strategies for Detection and Characterization of Antibodies against Biotechnology Products
 Koren et al (2008) JIM
 Risk Based Approach to Immunogenicity Concerns of Therapeutic Protein Products
 Rosenberg & Worobec (2004 & 2005) BioPharm International

Perceived Risk Level drives Immunogenicity Strategy¹⁸

Type of Biotherapeutic	Perceived Risk	Sample Collection Frequency	Sample Testing Frequency
"Replacement Tx" w/ Non-Redundant Critical Endogenous Homolog	High	More frequent during all phases of clinical development	Consider whether real-time sample analysis would impact patient treatment
"Replacement Tx" w/ Redundant Homologue, Protein with unique structure, some mAbs	Medium	More frequent during Phase I,II, less frequent during Ph III	Typically Batch analysis.
Some mAbs	Low	Same as for Medium Risk	Batch analysis

Interpreting Immunogenicity Data in Context 21

Product Insert - "Immunogenicity" Section for Lucentis

As with all therapeutic proteins, there is the potential for an immune response in patients treated with LUCENTIS.

The pre-treatment incidence of immunoreactivity to LUCENTIS was 0%-5% across treatment groups.

After monthly dosing with LUCENTIS for 6 to 24 months, antibodies to LUCENTIS were detected in approximately 1%-8% of patients.

The clinical significance of immunoreactivity to LUCENTIS is unclear at this time.

Immunogenicity Risk & Product Quality 24

Immunogenicity is a key metric of product safety & product quality.

- Most product related variants assumed to have low immunogenic potential
- Some product related variants & process related impurities could lead to an increased risk of immunogenicity

Product related variants & process related impurities that may lead to an increased risk of immunogenicity are "high criticality" product quality attributes. These are tracked as CQAs in QBD product control systems.

Key Take-Aways

29

- Immunogenicity is a key metric of product safety & product quality.
- Drivers of unwanted immune responses to therapeutic proteins are complex & nuanced
- Immunogenicity cannot be predicted and must be assessed in each indication for a therapeutic protein.
- Fit for purpose methods and "tiered" strategies are used to assess immunogenicity
- Immunogenicity data must be assessed in context of PK, PD, safety, & efficacy.
- Immunogenicity clinical consequences vary but can be severe.
